The present sequence encodes one of 32 novel human secreted polypeptides. The nucleic acid molecules and polypeptides they encode may be used in the nucleic acid molecules and prepared they encode may be used in the nucleic acid molecules and treatment of diseases such as immune disorders (e.g. multiple sclerosis, systemic lupus erythematosus and human immuno-deficiency virus (HIV) infections), hyperproliferative disorders (e.g. scimitar syndrome, Chaga's cardiomyopathy and coronary arteriosclerosis), andiogenic disorders (e.g. corneal graft neovascularisation and diabbetic retinopathy, neurological disorders (e.g. Huntington's chorea, Alzheimer's disease and Parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and/or chemotaxis. The nucleic acid molecules may be used to produce the secreted polypeptides. They may also be used as DNA probes in disquostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples. The polypeptides may be used as antigens in the their expression and activity. and/or treating e.g. cancers, Parkinson's Nucleic acids encoding 32 human secreted polypeptides, useful preventing, diagnosing and/or tru disease and diabetic retinopathy Claim 1; Fig 4; 890pp; English.

Isolated nucleic acid molecule encoding an inflammation-associated polypeptide is used in preventing, treating or ameliorating a medical condition $\,$

claim 1; SEQ ID NO: 134; 859pp + Sequence Listing; English.

The present invention provides human cDNAs, proteins and related genomic DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and prollierative disorders and inflammation. The present sequence is a cDNA of the invention.

The present sequence encodes one of 32 novel human secreted polypeptides.

The nucleic acid molecules and polypeptides they encode may be used in the nucleic acid molecules and polypeptides they encode may be used in the prevention, diagnosis and treatment of diseases such as immune disorders (e.g. multiple sclerosis, systemic lupus erythematosus and human immuno-deficiency virus (HIV) infections), hyperproliferative disorders (e.g. schimter syndrome. Chaga's cardiomyopathy and coronary arteriosclerosis), angiogenic disorders (e.g. corneal graft nervascularisation and diabetic retinopathy), neurological disorders (e.g. Huntington's chorea, Alzheimer's diseases and Parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and/or chemotaxis. The nucleic acid molecules may be used to produce the secreted polypeptides. They may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples. The polypeptides may be used as antigens in the production of antibodies and in assays to identify modulators of

Novel nucleic acid sequences encoding TANGO-128, 140, 197, 212, 213, 224 and 239 polypeptides useful for the treatment of asthma, rheumatoid arthritis, psoriasis and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding TANGO polypeptides are useful as modulating agents for regulating cellular processes like asthma, graft versus-host diseases, rheumatoid arthritis, postiasis, inflammatory bowel disease, septic shock, ulcerative colitis, Crohn's disease, chronic myelogenous leukemia, cancer, liver disease, Hodgkin's disease, osteoarthritis, Lyme's disease, cachesta and autoimmune disease, or myasthemia gravis, autoimmune diabetes and systemic lupus erythematosus. The nucleic acids are also useful for producing transgenic animals and the TANGO polypeptides themselves. Partial TANGO-128, 140, 197, 212, 213, 239, sequences are useful in forensic biology, for diagnostic assays, prognostic assays, prognostic assays, pharmacogenomics and for monitoring clinical trials. TANGO polypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a disorder associated with aberrant TANGO expression. A wide range
                                                                                                                                                                                                                        cachexia; autoimmune disease; myasthemia gravis; autoimmune diabetes; systemic lupus erythematosus; transgenic animal; diagnosis; prophylatic; therapeutic; human; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 atggaatgetgeegtegggeaacteetggeacactgeteetettetggettteetgete 60

agents for regulating cellular processes like asthma, graft versus-host diseases, rheumatoid arthritis, psoriasis, inflammatory bowel diseases, septic shock, ulcerative collitis, Crohn's disease, chronic myelogenous leukemia, cancer, liver disease, Hodykin's disease, chronic myelogenous leukemia, cancer, liver disease, Hodykin's disease, osteoarthritis, Lyme's disease, cachexia and autoimmune diseases e.g. myasthemia gravis, autoimmune diabetes and systemic lupus erythematosus. The nucleic acids are also useful for producing transgenic animals and the TaNGO polypeptides themselves. Partial for ENGO-128, 140, 197, 212, 213, 224, 239 sequences are useful in for forensic biology, for diagnostic assays, prognostic assays, pharmacogenomics and for monitoring clinical trials. TANGO polypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a disorder associated with aberrant TANGO expression. A wide range
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         540

New human signal peptide-containing proteins useful in treatment, prevention and diagnosis of e.g. cancer, inflammation and cardiovascular disease

9; Page 321-322; 327pp; English. Claim

AAZ98109 to AAZ98242 encode AAY87224 to AAX87357 which represent the buman signal peptide-containing proteins HSPP-1 to HSPP-134. HSPPs have human signal peptide-containing proteins HSPP-1 to HSPP-134. HSPPs have anticancer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, neuroprotective, cardiovascular and antiasthmatic activities, and can be used in gene therapy. HSPPs can be used to treat or prevent disorders associated with decreased activity or function of HSPP. Antagonists of HSPP are used to treat or prevent disorders associated with increased activity or function of HSPP. Such diseases include cell proliferation (including cancer), inflammation, cardiovascular, neurological, creproductive or developmental disorders, (e.g. arterioscierosis, cirrhosis, psoriasis, acquired immune deficiency syndrome, anaemia, asthma, Crohn's disease, microbial or other infections, congestive or ischaemic heart disease, Alzheimer's, Parkinson's or Huntington's diseases, schizophrenia, ovulatory defects, muscular dystrophy; Gradiagnosis and monitoring), in gene therapy, as antisense, chizophrenia, ovulatory defects, muscular dystrophy; for detecting HSPP in standard hybridisation and amplification assays (for diagnosis and monitoring), in gene therapeutics, for detecting related sequences or genetic variations, and for chromosomal mapping. HSPP are also used to raise specific antibodies (Ab) and to screen for agonists and cantagonists and cantagonists in competitive drug screens, and for purification of HSPP from mathyral sources (in usual immunoassays), as therapeutic from antiponists, and competitive drug screens, and for purification of HSPP from antiponists, in competitive drug screens, and for purification of HSPP

The present invention provides human cDNAs, proteins and related genomic DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a cDNA of the invention.

Isolated nucleic acid molecule encoding an inflammation-associated polypeptide is used in preventing, treating or ameliorating a medical condition

2001-476161/51.

ij Chen ΚP, Baker Yuan J, Gurney A, Goddard A, Wood WI,

WPI; 1999-551358/46 P-PSDB; AAY41729 secreted and transmembrane polypeptides and their polynucleotides. useful for treating adhesion disorders -New

2; Fig 119; 530pp; English. Claim The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and isorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AA233891 to AA23438, and AA41685 to AA41774 represent polynucleotide and invention.

AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polyneptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide target cells, e.g. for the transment of cancers. The polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78600 to AAC78987 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel PRO polypeptides and polynucleotides used in detection methods, to target bioactive molecules to specific cells, and to modulate cellular activities -

and Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumours, such as prostate and breast tumours, in mammals to screen for modulators of the compounds -

Claim 2; Fig 435; 774pp; English.

Sequences AAS45925-AAS46231 represent DNA molecules encoding and PCR primers for PRO polypeptides of the invention. The sequences of the invention can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample comparing the level of expression of a PRO polypeptide in a test sample of of cells from the animal and a control sample of normal cells, whereby a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, compact of stimulate tumour necrosis factor (TNF) alpha release from human cused to stimulate tumour necrosis factor (TNF) alpha release from human compaction of differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also cused to tumour development, particularly advenal, inng, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian compacts, the used for genetic analysis of individuals with genetic disorders. This invention relates to murine and human ADAMTS-N (A disintegrin-like and metalloprotease domain with thrombospondin type I motifs) proteins, designated ADAMTS-5, 6, 7, 8, 9, 10 and RI. Also included in the invention are cDNA sequences encoding the proteins, and antibodies pecific for the proteins. The nucleic acid sequences and proteins may be specific for the proteins. The nucleic acid sequences and proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate ADAMTS-N expression. Disorders that may be treated using the nucleic acids, proteins and antibodies include, for example tumour cachexia, inflammation, dermatosparaxis in cattle or Ehlers-Danlos syndrome type VIIC (EDS-VIIC) in humans, erosion of articular cartilage in arthritic (both inflammatory and non-inflammatory) disease, and incontrolling embryogenesis and implantation of fertilised eggs. The controlling embryogenesis and implantation of fertilised eggs. The Murine and human 'A Disintegrin-like And Metalloprotease domain with ThromboSpondin type I motifs' proteins and the nucleic acids encoding them, useful for treating e.g. tumours, inflammation and arthritis -Claim 15; Fig 11; 181pp; English.

conquiration continued to process, system is considered to the Orex which represent the human OREX open reading frames 1 to 3161. The OREX cequences have activities such as: cytostatic; hepatotropic; vulnerary; antiporulant; antiantic; immunosuppressant; costeopathic; anticonvulsant; thrombolytic; coaquilant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressant; cardiant; thrombolytic; coaquilant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressant; cardiant; thrombolytic; coaquilant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressave; cardiant; hypotensive; dermatological; immunosuppressave; cardiant; hypotensive; antibacterial; antivital antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating the participation associated with an OREX associated disorder. The nucleic acids may be used to treat cancers, rucher associated acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthitis, cardinastic and infection, malarial, autoimmune disorders, systemic complements of fungal infection, malarial, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, condural haemoglobinurial, antinflammatory disease; to enhance conduration; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           540

Human BPTI/Kunitz inhibitor family homologue cDNA, SEQ ID NO:238. (first entry) 11-JAN-2002 ABA08462;

Human; cytokine; cell proliferation; cell differentiation; growth factor; cytostatic; osteopathic; vasotropic; cardiant; virucide; antibacterial; antifungal; vulnerary; antiulcer; ss. haematopoleeis regulation; tissue growth; immunomodulator; activin; inhibin; chemotaxis; chemokinesis; thrombolysis; oncogenesis; proliferation; metastasis; cancer; tumour; haematopoletic disorder; myeloid cell disorder; tumpoloid cell disorder; arthritis; chronic inflammatory condition; proliferative retinopathy; atherosclerosis; coronary heart disease; afterial ischaemia; bone disorder; osteoporosis; vascular growth disorder; tissue regeneration; wound healing; infection; immune disorder; cell culture; drug screening; gene therapy; antiinflammatory; antiasthmatic; antiarthritic; haemostatic; antiarteriosclerotic;

Homo sapiens

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABB10981-ABB12330 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, and inclosed of the invention, methods of detecting the nucleotides antibodies against the polypeptides, methods of detecting the nucleotides bind to polypeptides in a sample, and methods of detecting the nucleotides of the invention have homology to known proteins, thereby optimized to polypeptides of the invention have homology to known proteins, thereby polypeptides of the invention have homology to known proteins, thereby optimized the invention have bolypeptides of the invention may differential therapeutic applications. The polypeptides of the invention may differential therapeutic applications. The polypeptides of the invention may differential therapeutic applications. The polypeptides of the invention may differential therapeutic applications. The polypeptides of memoration activities; stem cell growth factor activity; immunomodulatory activity; tissue growth activity; immunomodulatory activity; activity; tissue growth activity; immunomodulatory activity; activities; preceptor or inhibin-related activities of involved in noncogenesis, cancer cell proliferation or metastasis.

Thrombolytic activities; receptor or liquid activities; or may been conditions, e.g., by protein or gene therapy. Such conditions include ancers, haematopoletic disorders (e.g., myeloid or lymphoid call or conditions, e.g., by protein or gene therapy. Such conditions include ancers, haematopoletic disorders (e.g., myeloid or lymphoid call schaemia bone disorders (e.g., osteoporosis), and abnormal repair growth. Polypeptides involved with tissue regeneration and repair growth. Polypeptides involved with tissue regeneration and repair growth. Factor activity may be used to promote cell growth. Factor activity may be used to promote oell growth. F Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject Claim 1; Page 421; 1963pp; English. the live include.

The live include NOV-12 and NOV-2b which are novel KIAA123-like include NOV-1, NOV-2a and NOV-2b which are novel KIAA123-like polypeptides NOV-3b. NOV-3b which are novel KIAA123-like polypeptides NOV-3b. NOV-4b. NOV-4c. NOV-4d and NOV-4e which are novel trypsin inhibitor-like polypeptides. NOV-X is used to identify a potential therapeutic agent that can modulate its activity and can be used for treating a pathology related to aberrant expression or aberrant physiological interactions of NOV-X. NOV-X or its DNA is used to determine the presence or predisposition to a disease associated with altered levels of NOV-X. NOV-X. Its DNA and its antibody are used to treat or prevent a pathology associated with NOV-X. The pathological states that can be treated or prevented are haematopoietic, cancer, immunological, tumour, neurodegenerative (e.g. Alzheiner's and pathological certility disorders. NOV-X and its DNA are used in pharmacogenomics for predictive medicine. NOV-X and its DNA are used in pharmacogenomics for predictive medicine. NOV-X DNA is used in gene therapy. The present

```
NOV-2a
       KIAA1233-like protein,
sequence is a DNA encoding human novel K
NOV-2a gene is located at chromosome 15.

DISEASE: DEFECTS IN ADAWTS2 ARE THE CAUSE OF DERWATOSPARAXIS, A RECESSIVELY INHERITED DISORDER CHARACTERIZED BY SEVERE SKIN FRAGILITY AND BIOCHEMICALLY BY THE PRESENCE IN SKIN OF PROCOLLAGEN
                                                                                                                                                                                                                    MATRIX (BY SIMILARITY).

-!- TISSUE SPECIFICITY: ENZYMATIC ACTIVITY IS DETECTED AT HIGH LEVEL
IN ALL TYPE I COLLAGEN-RICH TISSUES SUCH AS SKIN, BONES, TENDONS
AND AORTA AND AT LOW LEVEL IN BRAIN AND THYMUS. THE MRNA LEVELS.
WERE DISPROPORTIONATELY HIGH IN HEART, LIVER, RETINA AND MUSCLE.
-!- DOMAIN: THE SPACER DOMAIN AND THE TSP TYPE-1 DOMAINS ARE IMPORTANT
FOR A TIGHT INTERACTION WITH THE EXTRACELLULAR MAIRIX.
                                                                                                                                                                         -!- SUBUNIT: MAY BELONG TO A MULTIMERIC COMPLEX. BINDS SPECIFICALLY TO COLLAGEN TYPE XIV.
-!- SUBCELLULAR LOCATION: SECRETED. ASSOCIATED WITH THE EXTRACELLULAR
PROSITE; PS50025. ADAM_MEPRO; 1.

-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY MI2B.
-!- SIMILARITY: CONTAINS 1 DISINITEGRIN-LIKE DOMAIN.
-!- SIMILARITY: CONTAINS 4 TSP TYPE-1 DOMAINS.
-!- CAUTION: HAS SOMETIMES BEEN REFERRED TO ADAMTS3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Am. J. Hum. Genet. 65:308-317(1999).

-!- FUNCTION: CLEAVES THE PROPEPTIDES OF TYPE I AND II COLLAGEN PRIOR

-!- FUNCTION: CLEAVES THE PROPEPTIDES.

-!- FUNCTION: COLLAGEN. MAY ALSO
PLAY A ROLE IN DEVELOPMENT THAT IS INDEPENDANT OF ITS ROLE IN

COLLAGEN BIOSYNTHESIS.

-!- CARALYTIC ACTIVITY: Cleaves the N-propeptide of collagen chain
alpha-1(1) at Pro-|-Gln and of alpha-1(11) and alpha-2(1) chains

at Ala-|-Gln.
